We pave to please

Paved with perfection

In the last 35 years Bickhardt Bau AG has been one of Germany's leading construction contractors successfully completing numerous civil, mechanical engineering and building projects.

Motorway construction and road building have been our key services. Every year we

build millions of square meters of asphalt and concrete pavements. A large fleet of high-tech machinery and highly skilled and motivated workers ensure that the Bickhardt Bau Group fulfills its tasks to the great satisfaction of our clients and business-partners.

**We don't build just curves -
we create emotions**

The race is on

As a leading company within the German motorway and trunk road construction business Bickhardt Bau Aktiengesellschaft has acknowledged a special expertise in building Race Tracks over the past decades, which live up to the high standards and requirements of the Formula 1.

Bickhardt Bau not only redesigned Germany's F1 Race Course at Hockenheim but also paved the F1 Circuits in Shanghai and Bahrain with asphalt. As a result of the high quality work executed in these projects

by the Bickhardt specialists and their large fleet of state of art construction machinery Bickhardt Bau was awarded the contract to build the new F1 Race Course in Abu Dhabi in December 2007.

Work on the building site on Yas-Island has started in August 2008 leaving just a little more than 25 weeks to build the actual F1-Track. Brand new computer operated road pavers have been shipped to the United Arab Emirates to get the best results. The race is on.

We shape landscapes

Core of Construction

Earth moving is the core of construction. The Bickhardt Bau Group is therefore specialised in earthmoving, hard landscaping and bulk and detailed excavation. Our Company has a comprehensive fleet of state of the art machinery, ranging in size from compact excavators designed for detailed work in small spaces, through to heavy machinery for bulk excavation and large scale landscaping. Excavators, Bulldozers and Grader have been selected from the most recent machines available on the strength of their technological advances and compact designs, making it possible to achieve incredible results especially in difficult and confined working spaces. Our machines can be equipped with GPS navigation systems.

Engineering with expertise

Successful Solutions

Besides motorway construction and road building our range of services also cover railway construction and bridges. The Bickhardt Bau Group is experienced in all construction solutions for projects of all sizes.

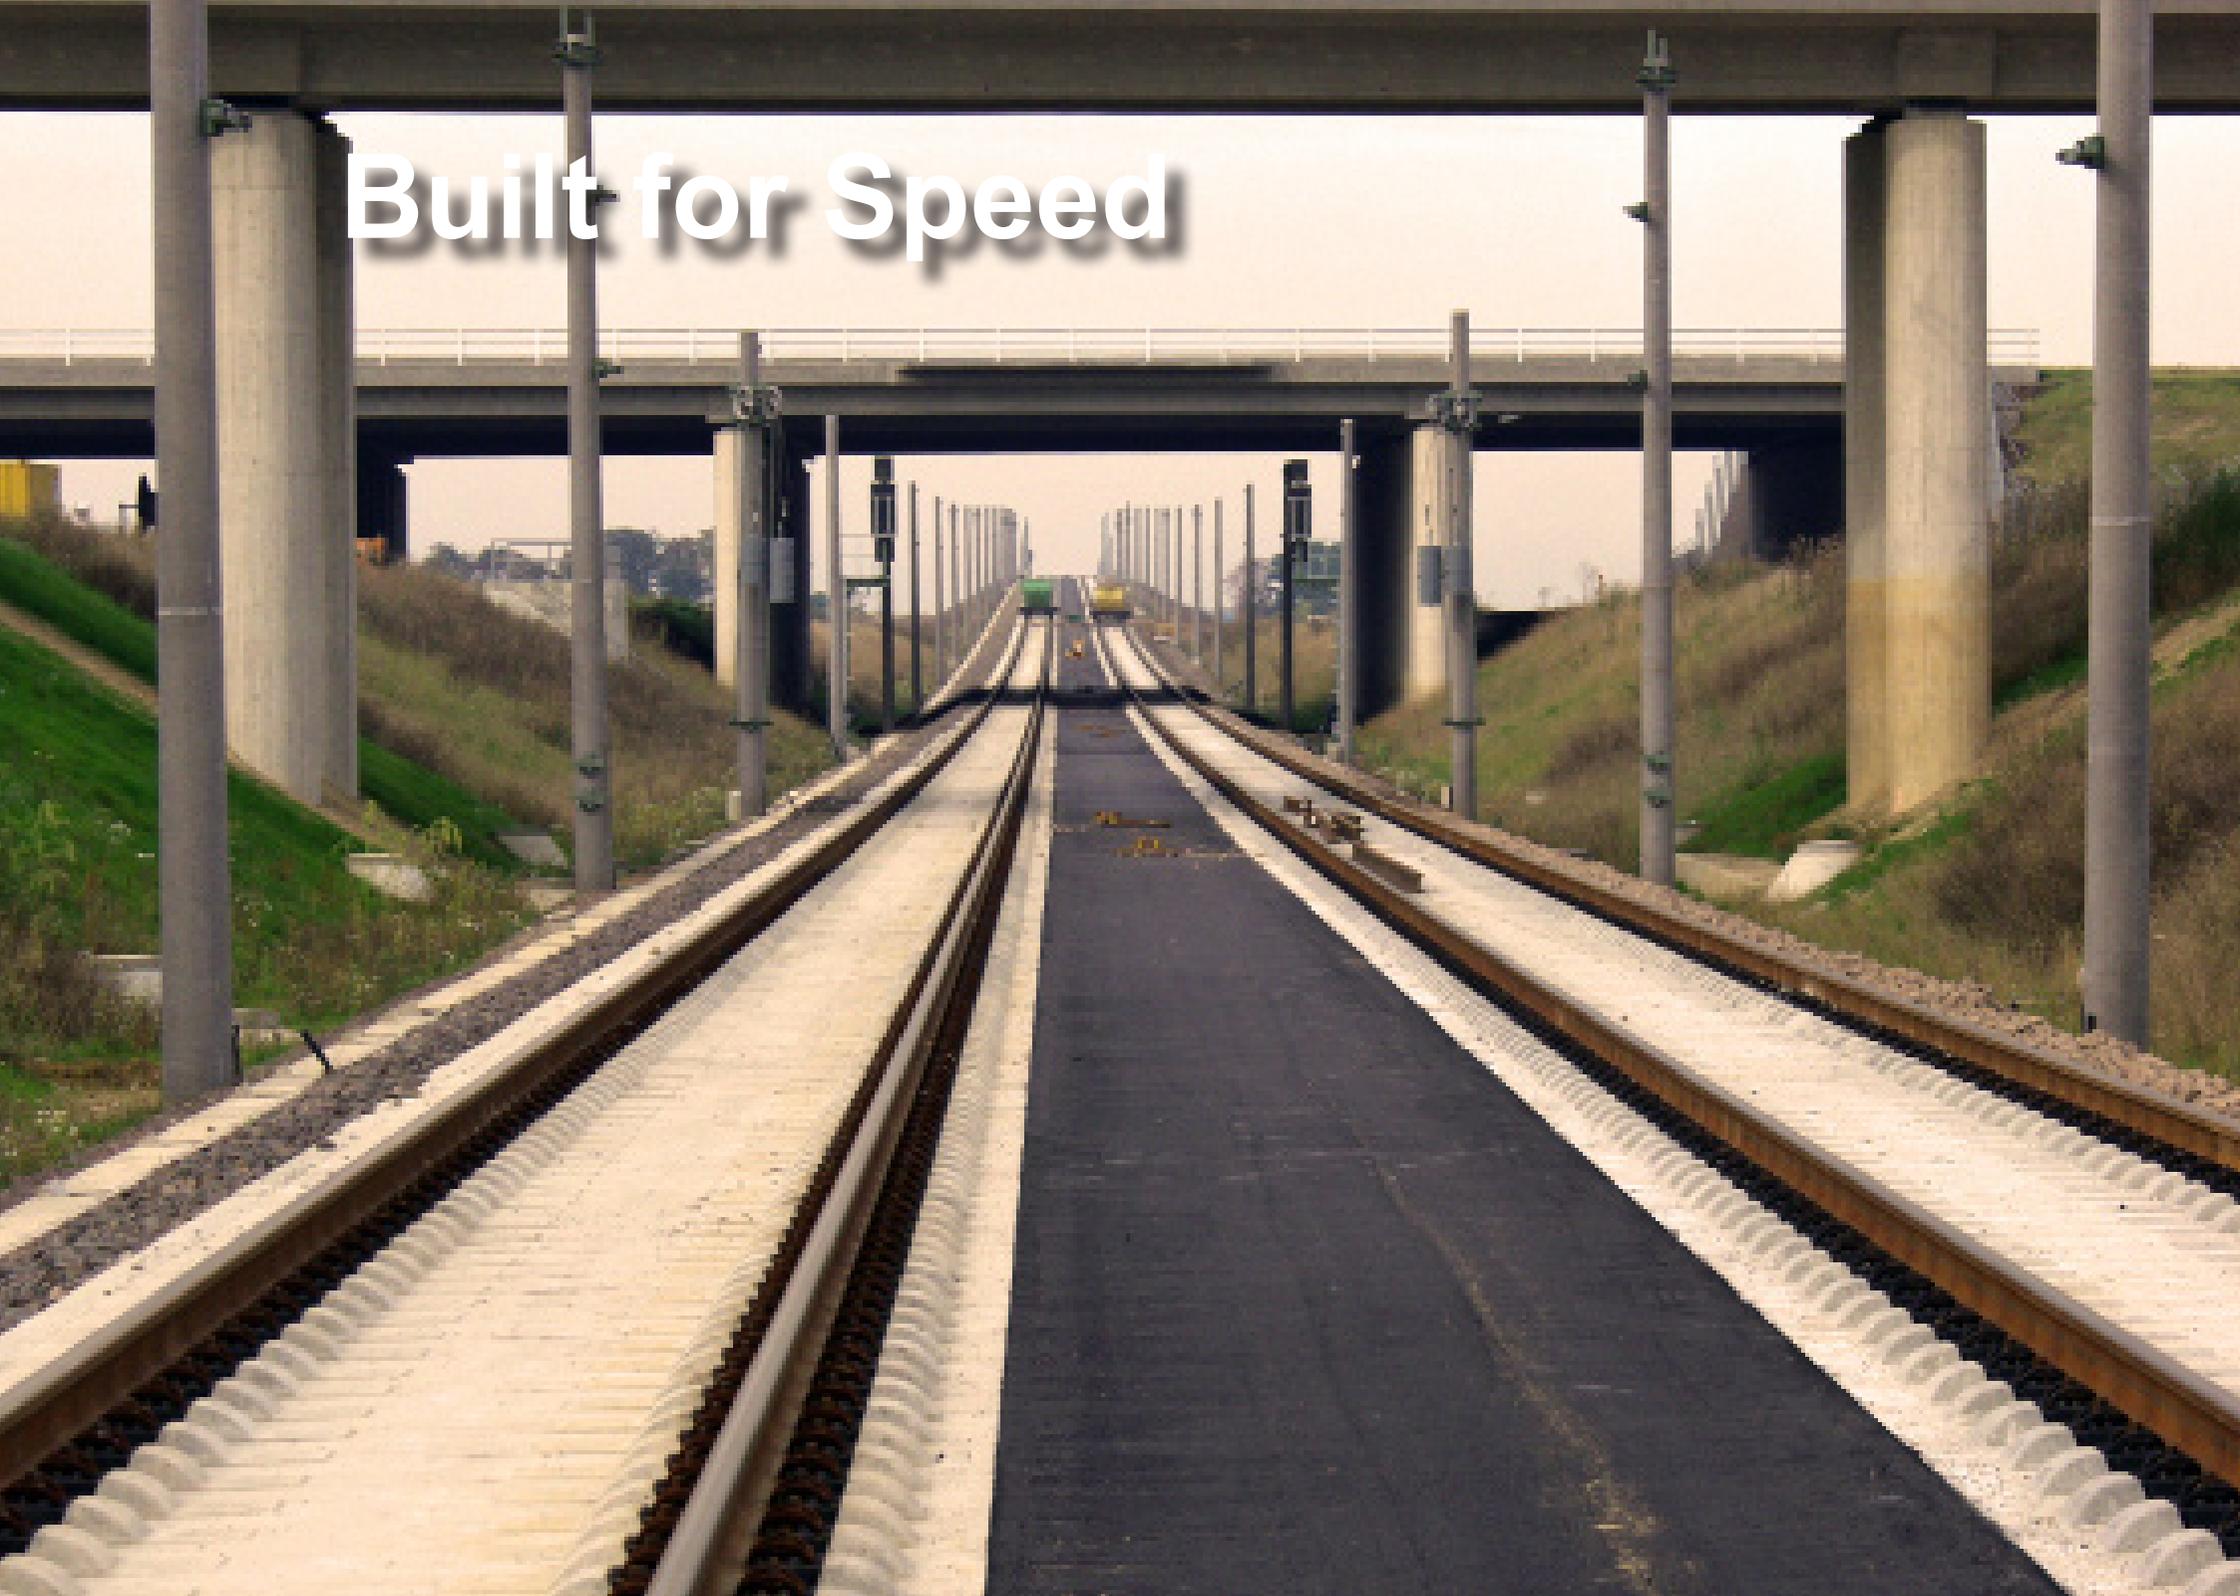

Over the last years our department of civil engineering and bridge construction has been one of the fastest growing units within

the Bickhardt Group. Our engineers develop successful solutions for a market, that demands all varieties of engineering works - from large bridges to free cantilevered construction and steel composite construction.

Further focal areas of work are environmental engineering with landfill sites, water and wastewater construction.

Built for Speed

Slab Track Systems

The constant modernization of railroad transport requires a high level of professional qualification in the design of structural systems. Bickhardt Bau AG has extended its competence and capability in railway construction by continuous processing of the most varied building sites. Modern high speed sections have led to innovative solutions in the construction of track systems. With increased demand on speed, comfort, reliability and environmental protection as well as long service life in combination with low costs, the concept of slab tracks has gained importance. Unlike traditional ballast trackbed, slab track consists of continuous concrete or asphalt strip, in which the track panel is integrated. Bickhardt Bau actively structures innovation and progress and is among the first successful users of this design.

**Sometimes it's just
a matter of perspective**

Ground Improvements

The integration of civil engineering methods guarantees a continuously high level of quality over complete route sections, trouble free coordination of different trades and considerable shortening of construction time.

In addition to road construction and bridge construction Bickhardt Bau has implemented a unit of Special Foundation Engineering in the last year to provide custo-

mers and clients with the best results from a single source.

As one of the most qualified units within the Bickhardt Group the Foundation specialists develop integrated solutions for deep foundations, ground improvements and excavations. The high level of expertise enables us to meet the highest quality and safety standards and provide economical, fast and flexible construction services.

**All services from
a single source**

Aligned to complement

Our fields of business have been aligned to complement each other. With subsidiary companies in the field of raw material extraction and processing we can ensure our clients high quality construction services from one single source. The Bickhardt Group owns and operates 18

quarrys, gravel pits and asphalt mixing plants.

Highly skilled professionals and a modern production line ensure an economically and environmentally friendly use of the resources.

Working hard for a better future

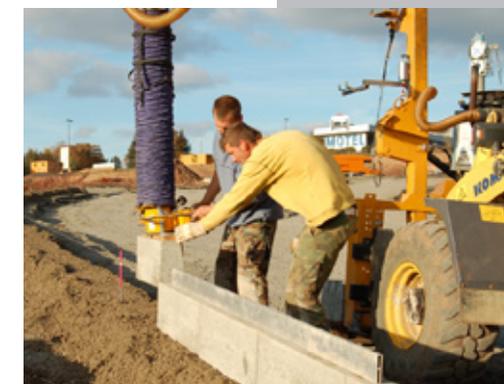

Men at Work

With its far sighted management, diligence and thought through decisions Bickhardt Bau has managed the transition from a family run business to a medium-sized stock corporation, which runs branches in Poland and the United Arab Emirates.

Our employees have been the key to our

success. Today the Bickhardt Group employs 1500 people. A special focus is put on our apprentices, who are trained in seven different professions covering a variety of jobs from industrial clerks/sales accountants and road builders to IT-network-administrators and certified industrial mechanics.
